

Throughout Internet Applications HTML, CSS, and JavaScript along with how to use Github were taught as preparation for us for when we go out into the job world for a career pertaining to librarianship. As many of us will not only be library technicians but also in charge of some sort of IT related job such as updating the webpage for any upcoming event and changes. In this case HTML would be beneficial, with the knowledge gained from Internet Applications one can easily update any simple webpage. Such as changing text and creating forms.

With the use of CSS and JavaScript, anyone can update a simple webpage with different graphics and animations. As a basic way to grab a person's attention, the use of colours and design is the easiest way to do it. This is where CSS and JavaScript can come in. HTML will contain all the necessary information and the CSS will handle the design. With CSS the font and text colour can change, the position of text and images can change, and adding a background design and section colours. If JavaScript is added to the page, image animation will be easier as well as controlling multimedia.
